

BE KIND TO YOUR GREENS

Introducing the Spray Bug, a new user friendly way to walk spray greens and other hard to reach areas.

Greens require personal attention and precise application control. Current walking booms are labor-intensive and difficult to use and calibrate. The Spray Bug changes all of that!

What is the Spray Bug?

The Spray Bug is an electric powered, self-propelled covered boom system with a self-contained 15-gallon spray tank and complete spray system. The operator walks in front of the boom system and not through the spray, and the wheels do not track through the application. Nozzles are visible to the operator while spraying. Because the Spray hose with reel is not needed. The spray tank can be spray vehicle or utility vehicle with the included, dry addition, individual batches can be mixed directly in

Bug is self-contained, a recharged from a larger lock transfer system. In the 15 gallon tank.

Ease of Use

The Spray Bug operates at a consistent 2.6 miles per hour with a cruise control that maintains that speed over rolling terrain for accurate calibration. Turning is easy and adjustable stops can be set to help in lining up for the next pass. A trailer is available for transportation around the golf course.

The outer wings and the handle fold up for compact transport.

Calibration is easy by adjusting the pressure bypass valve.

A dry lock fitting allows the operator to recharge the tank without exposure to the spray material.

New! A custom foam marking kit is available to accurately line-up for each pass and helps to assure accurate overlap.

Convenient power drive switch and spray control switch are located at the operator's fingertips.

The Spray Bug can be operated in both directions with a flip of a switch.
